Released for Printing: April 18, 1990

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Preface

The *Weekly Petroleum Status Report* (WPSR) provides timely information on the petroleum supply situation in the context of historical information, selected prices, and forecasts. The WPSR is intended to provide up-to-date information to the industry, the press, planners, policymakers, consumers, analysts, and State and local governments. It is published each Thursday by the Energy Information Administration (EIA) and excerpts of the data are available electronically after 5:00 p.m. Wednesday. The data contained in this report are based on company submissions for the week ending 7 a.m. the preceding Friday. For some weeks which include holidays, publication of the WPSR is delayed by 1 day. The WPSR is not published during 1 of the last 2 weeks of the year depending upon which day of the week Christmas occurs. The following week's issue includes data for both weeks.

General information about this document may be obtained from Charles C. Heath (202) 586-6860, Director of the Petroleum Supply Division, Office of Oil and Gas, Energy Information Administration; or James M. Diehl (202) 586-5985, Chief of the Fuels Analysis Branch; or James M. Kendell (202) 586-9646, Team Leader of the Heating Fuels Analysis Team.

Specific information about the data in this report may be obtained from Larry J. Alverson (202) 586-9664, or Diana R. House (202) 586-9667.

Highlights

Refinery Activity (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil Input to Refineries	12.9	12.9	13.0
Refinery Capacity Utilization (Percent) ..	84.3	84.1	83.9
Motor Gasoline Production	6.5	6.5	6.7
Distillate Fuel Oil Production	2.7	2.6	2.7

Distillate fuel oil production for the 4 weeks ending April 13, 1990, was about 2 percent greater than for the 4 weeks ending April 6, 1990. However, production was 2 percent below the level for the same period last year.

Stocks (Million Barrels)

	Week Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil (Excluding SPR)	371.3	370.4	331.6
Motor Gasoline	226.1	227.4	229.0
Distillate Fuel Oil	98.1	99.0	97.3
Other Oils	352.4	350.2	355.3
Crude Oil In SPR	582.3	582.3	566.9
Total*	1,630.2	1,629.3	1,580.1

Motor gasoline stocks declined for the sixth week in a row for the week ending April 13, 1990. However, crude oil stocks for the week ending April 13 were about 12 percent above those of last year.

Net Imports (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil	6.1	6.0	5.2
Petroleum Products	1.1	1.2	1.7
Total*	7.2	7.3	6.8

For the first 102 days of 1990, net crude oil imports were 15 percent higher than for the same period in 1989, while net imports of petroleum products were 16 percent less.

Products Supplied (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Motor Gasoline	7.3	7.3	7.3
Distillate Fuel Oil	3.2	3.3	3.2
Other Products	6.4	6.6	6.8
Total*	16.9	17.2	17.3

Total products supplied for the 4 weeks ending April 13, 1990, was slightly less than that for the 4 weeks ending April 6, 1990, and about 2 percent below last year.

Prices (Dollars per Barrel)

	Week Ending		
	04/13/90	04/06/90	04/14/89
World Prices			
World Crude Oil	14.67	16.27	17.85

Highlights

Refinery Activity (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil Input to Refineries	12.9	12.9	13.0
Refinery Capacity Utilization (Percent) ..	84.3	84.1	83.9
Motor Gasoline Production	6.5	6.5	6.7
Distillate Fuel Oil Production	2.7	2.6	2.7

Distillate fuel oil production for the 4 weeks ending April 13, 1990, was about 2 percent greater than for the 4 weeks ending April 6, 1990. However, production was 2 percent below the level for the same period last year.

Stocks (Million Barrels)

	Week Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil (Excluding SPR)	371.3	370.4	331.6
Motor Gasoline	226.1	227.4	229.0
Distillate Fuel Oil	98.1	99.0	97.3
All Other Oils	352.4	350.2	355.3
Crude Oil In SPR	582.3	582.3	566.9
Total*	1,630.2	1,629.3	1,580.1

Motor gasoline stocks declined for the sixth week in a row for the week ending April 13, 1990. However, crude oil stocks for the week ending April 13 were about 12 percent above those of last year.

Net Imports (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Crude Oil	6.1	6.0	5.2
Petroleum Products	1.1	1.2	1.7
Total*	7.2	7.3	6.8

For the first 102 days of 1990, net crude oil imports were 15 percent higher than for the same period in 1989, while net imports of petroleum products were 16 percent less.

Products Supplied (Million Barrels per Day)

	Four Weeks Ending		
	04/13/90	04/06/90	04/13/89
Motor Gasoline	7.3	7.3	7.3
Distillate Fuel Oil	3.2	3.3	3.2
All Other Products	6.4	6.6	6.8
Total*	16.9	17.2	17.3

Total products supplied for the 4 weeks ending April 13, 1990, was slightly less than that for the 4 weeks ending April 6, 1990, and about 2 percent below last year.

Prices (Dollars per Barrel)

	Week Ending		
	04/13/90	04/06/90	04/14/89
World Prices			
World Crude Oil	14.67	16.27	17.85
Spot Market Product Prices ¹			
Rotterdam Market			
98 Octane Gasoline (Leaded)	24.62	26.85	30.95
Gas Oil	21.18	22.12	21.25
Residual Fuel Oil	12.61	13.81	16.44
New York Market			
87 Octane Unleaded Reg Gasoline	25.20	26.46	28.71
No. 2 Heating Oil	25.03	23.98	22.20
Residual Fuel Oil	14.85	15.50	18.50

On April 13, 1990, the spot market price of unleaded motor gasoline was 5 percent less, while distillate fuel oil on the New York Market was 4 percent above the levels on April 6, 1990, according to Petroleum Publications, Inc. The world crude oil price for the week ending April 13 was 10 percent less than the previous week's price.

¹ Includes lease condensate.² Net Imports = Gross Imports (line 3) + Strategic Petroleum Reserve (SPR) Imports (line 4) - Exports (line 5).³ Unaccounted-for Crude Oil is a balancing item. See Glossary for further explanation.⁴ Includes finished petroleum products, unfinished oils, gasoline blending components, and natural gas plant liquids.⁵ Includes an estimate of minor product stock change based on monthly data.⁶ Includes crude oil product supplied, natural gas liquids, liquefied refinery gases (LRGs), other liquids, and all finished petroleum products except motor gasoline, jet fuels, and distillate and residual fuel oils.⁷ Includes crude oil in transit to refineries.⁸ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRGs, other hydrocarbons and alcohol, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils. For the current 2 weeks, stocks of these minor products are estimated from monthly data. (See Glossary: Stock change (Refined Products)).E=Estimate based on data published for the most recent month in the *Petroleum Supply Monthly*, except for crude oil production. See Appendix for explanation of estimates of crude oil production.

Note: Due to independent rounding, individual product detail may not add to total. The percentages shown are calculated using unrounded numbers.

¹ Product stocks include those stocks held at refineries, in pipelines, and at bulk terminals. Stocks held at natural gas processing plants are included in "Other Oils" and in totals. All stock levels are as of the end of the period.

² Crude oil stocks include those stocks held at refineries, in pipelines, in lease tanks, and in transit to refineries, and do not include those held in the Strategic Petroleum Reserve.

³ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRG's, other hydrocarbons and alcohol, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils. E=Estimated. See Glossary for definition of "Stock Change (Refined Products)" for explanation of other oils estimation methodology.

Note: Data may not add to total due to independent rounding.

Source: See page 25.

**Figure 2. Stocks of Crude Oil and Petroleum Products
(Million Barrels)**

¹ Excludes stocks held in the Strategic Petroleum Reserve and includes crude oil in transit to refineries.

² Average level and width of average range are based on 3 years of monthly data: July 1986 - June 1989. The seasonal pattern is based on 7 years of monthly data. See Appendix for further explanation.

³ The observed minimum for total stocks in the last 36-month period was 1003.2 million barrels, occurring in March 1989. See Appendix for further explanation.

⁴ The National Petroleum Council (NPC) defines the Minimum Operating Inventory as the inventory level below which operating problems and shortages begin to appear in a defined distribution system. In its 1988 study, the NPC estimated this inventory level for crude oil to be 300 million barrels. See Appendix for further explanation.

**Figure 5. Stocks of Residual Fuel Oil
(Million Barrels)**

¹ Average level and width of average range are based on 3 years of monthly data: July 1986 - June monthly data. See Appendix for further explanation.

² The National Petroleum Council (NPC) defines the Minimum Operating Inventory as the inventory begin to appear in a defined distribution system. In its 1988 study, the NPC estimated this inventory level for further explanation.

Table 15. Weather Summary
(Population Weighted Heating Degree-Days¹)

Weather data reported in the *Weekly Petroleum Status Report* are taken directly from a computerized system implemented by the National Oceanic and Atmospheric Administration, Department of Commerce. The National Oceanic and Atmospheric Administration (NOAA)/NWS, as a U.S. Government Agency, does not endorse any consumer information services.

The weather for the Nation, as measured by population-weighted heating degree-days from July 1, 1989, through April 14, 1990, has been 3 percent warmer than last year and 5 percent warmer than normal.

U.S. Total Heating Degree-Days (Population Weighted) and by City

	1989-1990 This Year	1988-1989 Last Year	Normal	Percent Change	
				This Year vs. Last Year	This Year vs. Normal

Explanatory Notes

EIA Weekly Data: Survey Design and Estimation Methods

The Weekly Petroleum Supply Reporting System (WPSRS) comprises five surveys: the "Weekly Refinery Report" (EIA-800); the "Weekly Bulk Terminal Report" (EIA-801); the "Weekly Product Pipeline Report" (EIA-802); the "Weekly Crude Oil Stocks Report" (EIA-803); and the "Weekly Imports Report" (EIA-804). The EIA weekly reporting system, as part of the Petroleum Supply Reporting System, was designed to collect data similar to those collected monthly. In the WPSRS, selected petroleum companies report weekly data to EIA on crude oil and petroleum product stocks, refinery inputs and production, and crude oil and petroleum product imports. On the Forms EIA-800 through EIA-803, companies report data on a custody basis. On the Form EIA-804, the importer of record reports each shipment entering the United States. Current weekly data and the most recent monthly data are used to estimate the published weekly totals.

Sample Frame

The sample of companies that report weekly in the WPSRS was selected from the universe of companies that report monthly. All sampled companies report data only for facilities in the 50 States and the District of Columbia. The EIA-800 sample frame includes all petroleum refineries in the United States and its territories, industrial facilities that have crude oil distillation capacity and produce some refined petroleum products, and bulk terminals that blend motor gasoline. The EIA-801 sample frame includes all bulk terminal facilities in the United States and its territories that have total bulk storage capacity of 50,000 barrels or more, or that receive petroleum products by tanker, barge, or pipeline. The EIA-802 sample frame includes all petroleum product pipeline companies in the United States and its territories that transport refined petroleum products, including interstate, intrastate, and intracompany pipeline movements. Pipeline companies that transport only natural gas liquids are not included in the EIA-802 frame. Only those pipeline companies which transport products covered in the weekly survey are included. The EIA-803 sample frame consists of all companies which carry or store 1,000 barrels or more of crude oil. Included are gathering and trunk pipeline companies (including interstate, intrastate and intracompany pipelines), crude oil producers, terminal operators, storers of crude oil, and companies transporting Alaskan crude oil by water. The EIA-804 sample frame includes all importers of record of crude oil and petroleum products into the United States.

Sampling

The sampling procedure used for the weekly system is the cut-off method. In the cut-off method, companies are ranked from largest to smallest on the basis of the quantities reported during some previous period. Companies are chosen for the sample

beginning with the largest and adding companies until the total sample covers about 90 percent of the total for each item and each geographic region for which weekly data are published.

	Weekly Form	Monthly Frame Size	Weekly Sample Size
Refiners (Refineries)	EIA-800	168(255)	59(152)
Bulk Terminals	EIA-801	324	78
Product Pipelines	EIA-802	85	44
Crude Oil Stock Holders	EIA-803	172	77
Importers	EIA-804	1194	102

Collection Methods

Data are collected by mail, mailgram, telephone, Telex, and Telefax on a weekly basis. All canvassed firms must file by 5:00 p.m. on the Monday following the close of the report week, 7 a.m. Friday. During the processing week, company corrections of the prior week's data are also entered.

Estimation and Imputation

After the company reports have been checked and entered into the weekly data base, explicit imputation is done for companies which have not yet responded. The imputed values are exponentially smoothed means of recent weekly reported values for this specific company. The imputed values are treated like reported values in the estimation procedure, which calculates ratio estimates of the weekly totals. First, the current week's data for a given product reported by companies in a geographic region are summed. (Call this weekly sum, W_i .) Next, the most recent month's data for the product reported by those same companies are summed. (Call this monthly sum, M_i .) Finally, let M_t be the sum of most recent month's data for the product as reported by all companies. Then, the current week's ratio estimate for that product for all companies, W_t , is given by:

$$W_t = \frac{M_t}{M_s} \cdot W_i$$

This procedure is used directly to estimate total weekly inputs to refineries and production. To estimate stocks of finished products, the preceding procedure is followed separately for refineries, bulk terminals, and pipelines. Total estimates are formed by summing over establishment types.

Weekly imports data are highly variable on a company-by-company basis or a week-by-week basis. Therefore, an exponentially smoothed ratio has been developed. The estimate of total weekly imports is the product of the smoothed ratio and the sum of the weekly reported values and imputed values.

Response Rates

The response rate as of the day after the filing deadline is about 80 percent for the EIA-800, 75 percent for the EIA-801, 95 percent for the EIA-802, 80 percent for the EIA-803, and greater than 95 percent for the EIA-804. However, more forms are received the next day, bringing the final response rates up. Late respondents are contacted by telephone. Nearly all of the major companies report on time. The nonresponse rate for the published estimates is usually between 1 percent and 2 percent.

Estimation of Domestic Crude Oil Production

Data on crude oil production for States are reported to the Department of Energy by State conservation agencies. Data on the volume of crude oil produced on Federally-owned offshore leases are reported by the Minerals Management Service, U.S. Department of the Interior. There is a time lag of approximately 4 months between the end of the reporting month and the time when the monthly crude oil production information becomes available. In order to present more timely crude oil production values, the Energy Information Administration prepares monthly crude oil production forecasts which are based on historical production patterns and are summed to obtain the weekly and 4-week crude oil production values shown in this publication. Cumulative crude oil production values shown in the U.S. Petroleum Balance Sheet include revised estimates published in the *Petroleum Supply Monthly*.

Data Assessment

The principal objective of the Petroleum Supply Reporting System is to provide an accurate picture of petroleum industry activities and of the availability of petroleum products nationwide from primary distribution channels. The weekly data, which are based on sample estimates stemming largely from preliminary company data, serve as leading indicators of the monthly data. The weekly data are not expected to have the same level of accuracy as the preliminary monthly data when compared with final monthly data. However, the weekly data are expected to exhibit like trends and product flows characteristic of the preliminary and final monthly data.

To assess the accuracy of weekly statistics, monthly estimates derived from weekly estimates are compared with the final monthly aggregates published in the *Petroleum Supply Annual*. Although final monthly data are still subject to error, they have been thoroughly reviewed and edited, they reflect all revisions made during the year and they are considered to be the most accurate data available. The mean absolute percent error provides a measure of the average revisions relative to the aggregates being measured for a variable. The mean absolute 1988 weekly data was less than 3 percent for 19 petroleum variables analyzed. Most of the absolute percent errors of 3 percent or more were for the refined products imports series. The mean absolute percent error for weekly refined products imports was 15 percent. It should be noted that products imports data are not estimated from a sample with

the same precision as other petroleum variables. Weekly estimates for refined products imports are almost always low because small companies, which are not in the weekly sample, generally import large volumes of finished products only a few times during the year.

An analytical article, "Timeliness and Accuracy of Petroleum Supply Data," which assesses the differences between interim and final data on the 30 major petroleum variables, is published in the *Petroleum Supply Monthly* once each year.

Interpretation and Derivation of Average Inventory Levels

The national inventory (stocks) graphs for total petroleum products, crude oil, motor gasoline, distillate fuel oil, and residual fuel oil in this publication include features to assist in comparing current inventory levels with past inventory levels and with judgments of critical levels. Methods used in developing the average inventory levels and minimum operating levels are described below.

Average Inventory Levels

The charts displaying inventory levels of crude oil and petroleum products (p.7), crude oil (p.7), motor gasoline (p.9), distillate fuel oil (p.11), and residual fuel oil (p.13) provide the reader with actual inventory data compared to an "average range" for the most recent 3-year period running from January through December or from July through June. The ranges also reflect seasonal variation for the past 7 years.

The seasonal factors, which determine the shape of the upper and lower curves, are estimated with a seasonal adjustment technique developed at the Bureau of Census (Census X-11). The seasonal factors are assumed to be stable (i.e., unchanging from year to year) and additive (i.e., the series is deseasonalized by subtracting the seasonal factor for the appropriate month from the reported inventory levels). The intent of deseasonalization is to remove only annual variation from the data. Thus, deseasonalized series would contain the same trends, cyclical components, and irregularities as the original data. The seasonal factors are updated annually in October, using the 7 most recent years' final monthly data.

The seasonal factors are used to deseasonalize data from the most recent 3-year period (January-December or July-June). The average of the deseasonalized 36-month series determines the midpoint of the "average range." The standard deviation of the deseasonalized 36 months is then calculated after adjusting for extreme data points. The upper curve of the "average range" is defined as the average plus the seasonal factors plus the standard deviation. The lower curve is defined as the average plus the seasonal factors minus the standard deviation. Thus, the width of the "average range" is twice the standard deviation. The ranges are updated every 6 months in April and October (Table A1).

**Table A1. Values of Average Ranges in Inventory Graphs
(Million Barrels)**

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Residual Fuel Oil	48.1	44.4	43.4	41.4	43.7	43.7	45.0	42.5	46.0	49.2	50.6	51.0

Minimum Operating Inventories

The lines labeled "Minimum Operating Inventory" (MOI) on the stocks graphs for crude oil, motor gasoline, distillate fuel oil, and residual fuel oil represent estimates of those inventory levels made by the National Petroleum Council (NPC) and published in April 1989 in a report of the NPC's Committee on Petroleum Storage & Transportation. The NPC defines the MOI as the inventory level below which operating problems and shortages would begin to appear in a defined distribution system. The NPC report presents the findings of a study which was directed by the NPC Committee. MOI estimates presented in the report were developed by consensus through a decision-making process that relied on the judgement of Committee members based on their operating experience, on historical inventory trends, and on the results of an NPC survey of companies that provide primary inventory data to the Energy Information Administration. The estimated MOI values are: Crude oil -- 300 million barrels; motor gasoline -- 205 million barrels; distillate fuel oil -- 85 million barrels; and residual fuel oil -- 30 million barrels.

The NPC did not develop a minimum operating inventory level for total petroleum stocks. The line labeled "observed minimum" on the "Stocks of Crude Oil and Petroleum Products, U.S. Total" graph is the lowest inventory level observed during the most recent 36-month period as published in the *Petroleum Supply Monthly*.

Projections from the Short-Term Energy Outlook, January 1990

One of the most uncertain factors affecting the domestic short-term energy outlook is the world oil price, defined here as the nominal price of imported crude oil delivered to U.S. refiners. Because of this uncertainty, three different world oil price scenarios are employed. These scenarios are used to develop a base case projection and two alternative projections for domestic supply and demand.

Base Case

In the base oil price scenario, the world oil price decreases from \$18.75 per barrel in the fourth quarter of 1989 to \$18 in the first quarter of 1990, falls to \$17 in the second quarter of 1990, and then increases to \$18 for the second half of 1990 and throughout 1991. This scenario is based on the assumption that OPEC oil production will be well in excess of demand (as indicated by the large stock builds in the second and third quarters of 1990, adjusted for normal inventory changes), in the late winter and spring of 1990. Subsequently, OPEC production is assumed to move in balance with demand.

Alternative Cases

Low Demand

In the low oil price scenario, the world oil price decreases to \$15 per barrel in the first quarter of 1990 and remains at that level throughout the forecast period. In this scenario, it is assumed that the battle for market share between the Persian Gulf members of OPEC will continue, leading to higher OPEC oil production than in the base scenario. In addition, it is assumed that an even less robust picture emerges for economic growth than in the base case, lowering the growth rate of oil consumption, and that oil supplies from non-OPEC producers, including the Soviet Union, will exceed the rates expected in the base scenario.

High Demand

In the high oil price scenario, the world oil price increases to \$20 per barrel in the first quarter of 1990 and remains at that level throughout the forecast period. In this scenario, it is assumed that economic growth will be stronger than in the base case and, that with the extra impetus from abnormally severe weather, growth in oil consumption will be significantly higher. At the same time, it is assumed that Soviet and United Kingdom oil production will fall below the rates expected in the base case and that OPEC production accords will reduce overproduction by the Persian Gulf members.

For more detailed information on the forecast, please refer to the published report, January 1990 *Short-Term Energy Outlook*. Copies of the report are available from:

National Energy Information Center
Room 1F-048, Forrestal Building
1000 Independence Avenue, S.W.
Washington, DC 20585
Telephone (202) 586-8800

Calculation of World Oil Price

The weighted average international price of oil, shown in the "Highlights" on page 1 and on page 18, is an average calculated using specific crude oil prices weighted by the estimated crude oil export volume for each oil-producing country. To develop the table shown on page 18, a list of major oil producing/exporting countries was chosen. For each country, the contract selling price of one or more representative crude oils was determined by investigating a number of industry publications (i.e., "Oil Buyers' Guide", "Platt's Oilgram Price Report", "Petroleum Intelligence Weekly", and "Weekly Petroleum Argus") and by contacting oil market analysts.

Then, the appropriate crude oil volumes to be used as weighting factors for each country were determined. These volumes are estimates based on a number of sources which provide data on production, consumption, and exports for these countries. Export volumes for a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors. After the export volumes had been determined, simple mathematical weighted averages were calculated to arrive at the "Total OPEC," "Total Non-OPEC," and "Total World" prices.

The average United States (FOB) import price is derived by the same basic procedure as the world oil price, that is, taking the representative contract crude oil price of a specific crude oil from a particular country and weighting this price by a certain volume

of crude oil. In this case, the weighting factors are the volumes of crude oil imported into the U.S. from pertinent countries. Import volumes from a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors.

Both the import and export volumes are preliminary. Due to their origin, these estimates cannot be fully verified. These volumes are updated monthly, or more frequently when changes in oil market conditions make updating appropriate.

Explanation and Coverage of Spot Market Product Prices

Definition of spot market product prices for the Rotterdam market: Represent the mid point of the bid/asked price range for CIF cargoes scheduled for prompt arrival at Rotterdam (within 48 hours).

Definition of spot market product prices for the New York market: Represent last sale price reported or offered. Prices are ex-duty and do not include Federal or State taxes.

General definition of spot prices: A transaction concluded "on the spot," that is, on a one-time prompt delivery basis, usually referring to a transaction involving only one cargo of product. This contrasts with a term contract sale which obligates the seller to furnish product on an evenly-spread delivery basis over an extended period of time, usually for 1 year.

Coverage of petroleum product prices is restricted to and updated according to the major products traded. Major products are determined by the highest number of transactions and the highest volumes of product traded, e.g., 1987 replacement of the New York leaded regular gasoline series with the unleaded regular gasoline series.

Glossary

Barrel. A volumetric unit of measure for crude oil and petroleum products equivalent to 42 U.S. gallons.

CIF (Cost, Insurance, Freight). This term refers to a type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of a transaction differs from a "Delivered" purchase, in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay based on the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Cooling Degree-Days. The number of degrees per day the daily average temperature is above 65 degrees F. The daily average temperature is the mean of the maximum and minimum temperature for a 24-hour period.

Crude Oil. A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Lease condensate and drips are included but topped crude oil (residual) and other unfinished oils are excluded.

Crude Oil Input. The total crude oil put into processing units at refineries.

Degree-Day Normals. Simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period 1951-1980). These may be simple degree-day normals or population-weighted degree-day normals.

Distillate Fuel Oil. Includes No. 1, No. 2, and No. 4 fuel oils, and No. 1, No. 2, and No. 4 diesel fuels. These are light fuel oils used primarily for home heating, as a diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and for electric power generation.

FOB (Free On Board). Pertains to a transaction whereby the seller makes the product available within an agreed on period at a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.

Gas Oil. European designation for No. 2 heating oil, and diesel fuel.

Gross Inputs. The crude oil, unfinished oils, and natural gas plant liquids put into atmospheric crude oil distillation units.

Heating Degree-Days. The number of degrees per day the daily average temperature is below 65 degrees F. The daily average temperature is the mean of the maximum and minimum temperature for a 24-hour period.

Imports. Unless otherwise specified in this report, refers to gross imports. Imports of minor products ("other oils") include aviation gasoline, kerosene, unfinished oils, liquefied petroleum gases, plant condensate, petrochemical feedstocks, lube oils, waxes, special naphthas, coke, asphalt, and other miscellaneous oils.

Jet Fuel. Includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene quality product used primarily for commercial turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a product in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Liquefied Refinery Gases (LRG). Liquefied petroleum gases fractionated from refinery or still gases. Through compression and/or refrigeration, they are retained in the liquid state. The reported categories are ethane/ethylene, propane/propylene, normal butane/butylene, and isobutane. Excludes still gas.

Motor Gasoline. Finished leaded gasoline, finished unleaded gasoline, and blending components in the gasoline range. Production data represent finished leaded gasoline and finished unleaded gasoline. Stocks and imports data consist of the two types of finished gasoline and blending components. Stock change used in the calculation of motor gasoline product supplied is the change in finished motor gasoline stocks.

Operable Capacity. The maximum amount of input that can be processed by a crude oil distillation unit in a 24-hour period, making allowances for processing limitations due to types and grades of inputs, limitations of downstream facilities, scheduled and unscheduled downtimes, and environmental constraints. Includes any shutdown capacity that could be placed in operation within 90 days.

Petroleum Administration for Defense Districts (PADD). Five geographical areas into which the nation was divided by the Petroleum Administration for Defense for purposes of administration. These PADDs include the States listed below:

PADD I: Connecticut, Delaware, District of Columbia, Florida, Georgia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, South Carolina, Vermont, Virginia, and West Virginia.

PADD II: Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Wisconsin.

PADD III: Alabama, Arkansas, Louisiana, Mississippi, New Mexico, and Texas.

PADD IV: Colorado, Idaho, Montana, Utah, and Wyoming.

PADD V: Alaska, Arizona, California, Hawaii, Nevada, Oregon, Washington.

Population-Weighted Degree-Days. Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree days, each State is divided into from one to nine climatically homogeneous divisions which are assigned weights based on the ratio of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and these products are then summed to arrive at the State population-weighted degree-day figure. To compute national population-weighted degree-days, the Nation is divided into nine Census regions comprised of from three to eight States which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and these products are then summed to arrive at the national population weighted degree-day figure.

Processing Gain. The volumetric amount by which total output is greater than input for a given period of time. This difference is due to the processing of crude oil into products which, in total, have a lower specific gravity than the crude oil processed.

Products Supplied. A value calculated for specific products which is equal to domestic production plus net imports (imports less exports), less the net increase in primary stocks. Total products supplied is calculated as inputs to refineries, plus estimated refinery gains, plus other hydrocarbon input, plus product imports, less product exports, less the net increase in product stocks. Values shown for "Other Oils" product supplied are the difference between total product supplied and product supplied values for specified products. Other oils product supplied incorporates crude oil product supplied and reclassified product adjustment.

Refiner Acquisition Cost of Crude Oil. The average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC 1131. Imported crude oil is any crude oil which is not domestic oil. The composite is the weighted average price of domestic and imported crude oil. Prices do not include the price of crude oil for the SPR.

Refinery Capacity Utilization. Ratio of the total amount of crude oil, unfinished oils, and natural gas plant liquids run through crude oil distillation units to the operable capacity of these units. In the period 1979-1984 the refinery capacity utilization for all U.S. refineries ranged between 87 percent and 65 percent. The ratio for an individual refinery may fluctuate much more depending on the type of crude and other raw materials processed, the types of products produced, and the operating conditions of the refinery.

Residual Fuel Oil. Includes No. 5 and No. 6 fuel oils which are heavy oils used primarily for electric power generation, for

industrial and commercial space heating, as a ship fuel, and for various industrial uses.

Retail Motor Gasoline Prices. Motor gasoline prices calculated each month by the Bureau of Labor Statistics (BLS) in conjunction with the construction of the Consumer Price Index (CPI). These prices are collected in 85 urban areas selected to represent all urban consumers -- about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-service).

Stock Change (Refined Products). Component of Product Supplied calculation shown on U.S. Petroleum Balance Sheet. The product stock change shown on the U.S. Petroleum Balance Sheet for the current 4-week period is calculated in the following way; an average daily stock change is calculated for major refined products (i.e., all actual reported stocks); this stock change is added to an estimate for minor product stock change based on historical monthly data; a daily average stock change for refined product stocks for the 4-week period is then calculated. To calculate minor product stock change, the stock levels shown for other oils in the stock section of the balance sheet are used. These other oils stock levels are derived by: 1) computing an average daily rate of stock change for each month based on monthly data for the past 6 years; 2) using this daily rate and the minor stock levels from the most recent monthly publication to estimate the minor product stock level for the current period.

Stocks. For individual products in the WPSR, quantities held at refineries, in pipelines, and at bulk terminals which have a capacity of 50,000 barrels or more, and in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but included in "Other Oils" estimates and "Total."

Unaccounted-for Crude Oil. A term which appears in U.S. Petroleum Balance Sheet. It reconciles the difference between data (or estimates) about supply and data (or estimates) about disposition. Its value can be positive or negative since it is a balancing term. As it appears in the monthly publications, it reflects the accuracy of the reported data. Because the unaccounted-for crude oil figure reflects the accuracy of reported and estimated figures, one would expect the figure to be larger in balances using preliminary or estimated data and smaller in balances using final data. In fact, the published figures confirm this expectation. In the WPSR, 4-week averages for the previous year are interpolated from final monthly data, so that the unaccounted-for crude oil value for the previous year is considerably smaller than that for the current period.

United States. For the purpose of the report, the 50 States and the District of Columbia. Data for the Virgin Islands, Puerto Rico, and other U.S. territories are not included in the U.S. Totals.

**Energy Information Administration
Electronic Publication System (EPUB)
User Instructions**

Selected *Weekly Petroleum Status Report (WPSR)*, *Propane/Heating Oil Data (PROP)*, *Petroleum Supply Monthly (PSM)*, *Petroleum Marketing Monthly (PMM)*, *Weekly Coal Production (WCP)*, *Electric Power Monthly (EPM)*, *Natural Gas Monthly (NGM)*, and *Quarterly Coal Report (QCR)* statistics are now available electronically on the Energy Information Administration (EIA) Computer Facility. Public access to these machine readable statistics is possible by dialing (202) 586-8658 for 300 baud or 1200 baud line speeds. Communications are Asynchronous and require a standard ASCII-type terminal. There is no charge for this service. Although no password is required, you will be requested to use your telephone number as a user identifier. This service is available 7 days per week (8:00 a.m. - 11:00 p.m., Monday thru Friday, and 10:00 a.m. - 6:00 p.m., weekends and holidays). Weekly petroleum and coal statistics are updated on Wednesday (Thursday in the event of a Holiday) after 5:00 p.m. Monthly petroleum supply and marketing data for the current available month are also provided and are updated by 5:00 p.m. on or about the 20th of the month. Monthly statistics from the *Electric Power Monthly* are available on or about the first working day of each month. Monthly statistics on natural gas are available on or about the 20th of the month. Questions or comments on petroleum supply data should be directed to Steve Patterson at (202) 586-5994. Questions or comments on petroleum marketing data should be directed to Kenneth Platto at (202) 586-6364. Questions or comments on weekly propane supply data should be directed to Kathy Cavanaugh at (202) 586-2970. Questions or comments on propane/heating oil price data should be directed to Lamar Gowland at (202) 586-6608. Questions or comments on coal data should be directed to Noel Balthasar at (202) 254-5400. Questions on electricity data should be directed to Deborah Bolden at (202) 254-5672. Questions or comments on natural gas data should be directed to Jim Todaro at (202) 586-6305. Questions or comments concerning EPUB should be directed to Dale Bodzer at (202) 586-1257.

Access Instructions:

- 1) DIAL (202) 586-8658
- 2) HIT RETURN (CARRIAGE RETURN) TWO OR THREE TIMES UNTIL THE EPUB BANNER APPEARS
